IRRIGATED PASTURE SPRINKLER IRRIGATION-SOLID SET

Production Data: 12 AUM Production. 40 acres irrigated pasture.

Irrigated pasture is grown in the foothills and valley area of Western Placer and Western Nevada County. Nearly 32,000 acres of irrigated pasture were in production in 1970.

SOILS: Irrigated pasture is grown on almost all of the soil series in the valley and foothills, and it is one of the few irrigated crops that can be grown on the shallower soils in the area.

VARIETIES: The most widely adapted varieties are Ladino clover, Salina Strawberry clover, Broadleaf Birdsfoot trefoil, Narrowleaf Birdsfoot trefoil, orchard grass, perennial and annual ryegrass.

PLANTING: Most successful plantings in this area are made in October.

WATER: Irrigated pasture requires 3 to 4 acre feet of water per acre during the season. The irrigation water is applied 13 to 20 times during the growing season in the area. Three acre inches of water applied every 7 to 10 days is a good rule of thumb.

FERTILIZATION: 80 lbs. P_2O_5 /Acre (35 P/acre) is recommended as an annual application of phosphorous. Sulfur is necessary to obtain maximum production and a material such as single superphosphate containing phosphorous and sulfur should be used. Nitrogen fertilization increases grass production in irrigated pastures but sustained nitrogen fertilization will reduce the amount of legumes in the pasture composition.

HARVESTING: Most irrigated pasture is grazed from April or May to October. During the spring many growers have surplus feed and a portion of the irrigated pasture acreage is cut for hay.

This Sample Cost of Production is based on a 200 acre farm with 40 acres of irrigated pasture producing 12 AUM of feed per season and 10 acres cut for hay in the spring. The average life of irrigated pasture is considered to be 7 years for the purpose of this study.

Labor is figured at \$2.75 per hour for skilled and \$2.25 for common labor and this includes Social Security and Workman's Compensation, as well as fringe benefits.
