Extension Economist,  
Farm Management

## BASIS OF FIELD CORN COST STUDY

1. This study is based on a 1,500 acre field crop operation with 500 acres of field corn. Other crops grown on the ranch may include one or more of the following crops: grain, alfalfa hay, grain sorghum, sugar beets, dry beans, safflower, etc. Much of the equipment is used on the entire acreage some-time during the year.

For reasons of simplicity, we used a landlord-tenant operation with a 75-25 division of the crop. The crop was sold "roadside" at 20% moisture. The landlord pays his own drying costs.

2. In allocating the equipment cost per acre the following calculations were made: (a) "Original Cost" of equipment is the estimated new cost and includes 6% sales tax. (b) "Cost Per Acre" is the new cost divided by the number of acres the equipment will be used on. (c) "Depreciation" is based on the "Per Acre Cost" divided by the expected life of the equipment. (d) "Interest" on investment is figured on one-half of the new cost per acre multiplied by 8%.
3. Miscellaneous expenses are estimated to be about 6% of the total cultural and harvest costs. They include such costs as preparing roadways, general weed control, office, bookkeeping, interest on operating money, etc.
4. Labor costs are based on a \$4.25 hourly rate for skilled labor and \$3.25 hourly rate for unskilled (irrigator). Included are cash wages, compensation insurance, Social Security and other benefits that the employer might pay.
5. Equipment operating costs are listed under fuel and repair. Included is the cost of fuel, maintenance, replacement parts, tires, etc. Tractor charges per hour are: 100-120 HP track diesel \$9.65; 80-90 HP track diesel \$7.50; 100 HP wheel diesel \$4.80 and 80-90 HP wheel diesel \$4.40. This and other information was partially taken from "Machinery Costs and Performance, 1972" (adjusted) by A.D. Reed, University Extension Economist, U.C. Davis.
6. Management (what the grower's decision making is worth) is figured at 5% of the market value of the crop.
7. Provided in this sample study are two different methods of production. One area of production includes silt loam soils which are slow to absorb water. Consequently, corn is planted in a furrow and irrigated via the border and check method.

In other areas of production which include deep loams and clays corn is usually planted on a bed and either pre-irrigated or irrigated up.

8. These sample costs may not represent the cost of any one individual grower but should serve as a useful guide in reviewing the typical costs in field corn production. Growers are encouraged to make use of the column "Grower Costs Per Acre" to permit a comparison of the costs in this study with their own.
9. Growers from Glenn and Butte Counties participated in furnishing information for compiling the basic information in this study. Some information was obtained from agribusiness representatives. Appreciation is expressed to them for their time and help.

EQUIPMENT AND BUILDING LIST

On Deep Loams and Clays

ITEM	ORIGINAL COST	ANNUAL USE (ACRES)	COST PER ACRE	LIFE (YEARS)	NON-CASH OVERHEAD	
					DEPRECIATION	INTEREST AT 8%
Tractor, 100-120 HP Tr. Diesel	\$ 51,500	1,500	\$ 34.33	20	\$ 1.72	\$ 1.37
Tractor, 80-90 HP Tr. Diesel	40,000	1,500	26.67	20	1.33	1.07
