WHITE FIR CHRISTMAS TREE COST STUDY

Prepared by

Arthur L. Scarlett - Farm Advisor

Philip S. Parsons - Extension Economist

Charles Wegerer - Service Forester
California Division of Forestry

Special thanks to Bill Beskeen, Quincy,
for his assistance in the cost and return study.

WHITE FIR CHRISTMAS TREE COST STUDY - Rev. Jan 1973

The cost study represents production from cut-over timber land. The costs in this study do not represent what necessarily would apply to any individual operation. The information should be used as a guide to analyze the individual operator's Christmas tree production, and provides a means of studying various costs.

Management and harvest costs are based on 10 years experience on a cost-return test plot near Quincy on mixed conifer cut-over land. Harvesting and management data collected from four managed $\frac{1}{2}$ acre plots with a stem population of 606 trees per acre was used for the "Managed Cost-Return Analysis", and from two unmanaged $\frac{1}{2}$ acre plots for the "Unmanaged cost-Return Analysis".

The study considers a managed situation Table I, and an unmanaged situation Table II of 50 acres of cut-over forest land. The areas are stocked with a population of 500 white fir trees per acre. These 50 acres as represented on any ownership may be scattered in smaller lots, but for purposes of the study a 500 tree population per acre was used.

Labor costs include both cash and fringe costs. The cash cost at \$3.00/hour and fringe costs (workmens compensation, social security and other) at 60¢/hour.

MANAGED SITUATION - TABLE I

The cash costs of managing, harvesting and miscellaneous costs including office, interest on operating capital, taxes, etc., represent nearly 50% of the total costs.

The remaining costs are slightly over 50% of the total, they include overhead costs on equipment, interest on land; these costs are high on equipment because of the limited acreage on which the equipment is used. We are assigning all over-head costs to 50 acres. If this was spread over 100 acres or 200 acres the overhead costs per acre would be decreased appreciably.

If available, consideration should be given to contracting or renting equipment for the few weeks of annual use. This would be especially the case with the unmanaged situation.

Depreciation on the four-wheel drive pickup with a new cost of \$4,800.00 is figured on a 15 year life, the trailer 15 year life and the chain saw five year life. Depreciation shown for the pickup truck of \$6.40 an acre is based upon \$96.00 the investment per acre divided by a 15 year life.

Interest on equipment is based upon a rate of 7% of $\frac{1}{2}$ of the new cost. Another way of saying it is, 7% of the average cost. The buildings valued at \$5,000 have use for equipment storage.

The management charge of 5% of gross income is to cover decision making, planning, etc.

Land is valued at \$200 an acre, which may be a reasonable figure for a fairly large acreage of cut-over-land. Land is not depreciable in the sense that equipment and buildings are, and the interest is charged on the full value. Bulldozer costs are on the basis of a D8 machine including the operator at \$24.00 an hour. All of the other equipment is assumed to be owned and the cost of it is shown as cash costs including fuel and repairs and overhead costs including depreciation, interest, taxes and insurance.

This study shows that over a fifteen year period a total of \$795.95 of income over costs or \$53.06 per acre per year would be enjoyed.

It appears that with management a higher quality tree which should command a higher price results. A constant value of 65¢/ft. was used for the managed trees.

UNMANAGED SITUATION - TABLE II

Here no management or improvement work of any kind is done. Suitable trees in numbers shown were harvested during the first five years of the study. After that, the closing canopy of trees being allowed to mature for timber production would reduce the production suitable for Christmas trees to approximately five per acre per year. The total income during the first five years would be \$587.20 or \$117.44 per acre per year. From then on the production would slow down and show a negative value when charged against the other stated costs.

The difference in price per foot after the third year on the unmanaged is due to lower quality trees.

The minutes per tree for harvesting and processing; and management work were the result of data collected on the cost and return test plots. This will vary with each operator depending on type of stand, accessibility, available equipment, experienced labor, topography, etc.
