BARLEY

costs of production

suggestions on growing

UNIVERSITY OF CALIFORNIA
FARM AND HOME ADVISORS' OFFICE
KERN COUNTY
REVISED JANUARY, 1960
UC COOPERATIVE EXTENSION
PLANTING RATE:

On irrigated land; early planting close drilled, 80 to 90 lbs. per acre is sufficient. On irrigated land; late planting close drilled; 90 to 100 lbs. per acre. On non-irrigated land; close drilled, 50 lbs. per acre. Usually one-fourth more seed is required when broadcast.

PLANTING TIME:

Between November 15 and December 15 is the best time to seed. California Mariout, being an early maturing variety, should not be planted before December 1.

PLANTING DEPTH:

The depth of planting should be governed by type of soil and soil moisture. In most cases, 2 inches is sufficient.

FERTILIZATION:

Unless barley is to follow alfalfa or other truck crops where there is a large amount of nitrogen left in the soil, nitrogen fertilizer is needed in most soils in the county to produce maximum yields. Sixty lbs. of nitrogen (300 lbs. of ammonium sulfate or its equivalent) is recommended. If phosphate is now being used on other crops in the area, then 80 lbs. of actual phosphate (200 lbs. treble super phosphate) would be sufficient.

IRRIGATION:

There are three times when adequate moisture is important for cereal grains.

1. When plants are about 6 inches tall. At this stage they are completing tillering.

SUGGESTIONS ON GROWING BARLEY

By Roy M. Barnes - Farm Advisor

SOIL REQUIREMENTS:

Barley is adapted to most Kern County soils and is a good crop to grow on alkali land. Also, barley can be double cropped with milo.

VARIETY:

Atlas 46, Arivat, California Mariout, and Club Mariout are the varieties recommended for Kern County. Atlas 46 is a variety well suited for malting purposes and is resistant to mildew and scald. Arivat, California Mariout, and Club Mariout are grown for feed. Atlas 46 and Club Mariout mature at mid-season and are suited to early planting. Arivat and California Mariout mature 5 to 12 days earlier and are suited for late plantings. California Mariout will do well on alkali soils. Always plant certified seed to give the crop all the advantages at the beginning.

SEED TREATMENT:

Seed should be treated to guard against smut and stripe. One ounce per 100 lbs. of grain of New Improved Ceregan is recommended.

PREPARATION OF SOIL AND PLANTING:

On irrigated land, the soil should be worked to be firm—much the same as alfalfa. Pre-irrigation is always best to insure ample moisture during germination and through the stooling period. The same preparation is made to the land which is non-irrigated, except planting usually follows one year of summer fallow. In either case, planting may be done with a grain drill or broadcast.
COSTS TO PRODUCE BARLEY IN KERN COUNTY - (SINGLE CROP)

Based on man labor at $1.00 and $1.30 per hour; 30 H.P. WHEEL TRACTOR CASH COST PER HOUR $1.00;
Depreciation $.41; Interest $.19

SUGGESTIONS ON GROWING BARLEY

By Roy M. Barnes - Farm Advisor

SOIL REQUIREMENTS:

Barley is adapted to most Kern County soils and is a good crop to grow on alkali land. Also, barley can be double cropped with milo.

VARIETY:

Atlas 46, Arivat, California Mariout, and Club Mariout are the varieties recommended for Kern County. Atlas 46 is a variety well suited for malting purposes and is resistant to mildew and scald. Arivat, California Mariout, and Club Mariout are grown for feed. Atlas 46 and Club Mariout mature at mid-season and are suited to early plantings. Arivat and California Mariout mature 5 to 12 days earlier and are suited for late plantings. California Mariout will do well on alkali soils. Always plant certified seed to give the crop all the advantages at the beginning.

SEED TREATMENT:

Seed should be treated to guard against smut and stripe. One ounce per 100 lbs. of grain of New Improved Ceregan is recommended.

PREPARATION OF SOIL AND PLANTING:

On irrigated land, the soil should be worked to be firm--much the same as alfalfa. Pre-irrigation is always best to insure ample moisture during germination and through the stooling period. The same preparation is made to the land which is non-irrigated, except planting usually follows one year of summer fallow. In either case, planting may be done with a grain drill or broadcast.
AND STARTING ELONGATION. ALSO, AT THIS TIME
THE TOTAL NUMBER OF HEADS AND THE NUMBER OF
POTENTIAL FLORETS PER HEAD IS BEING DETERMINED.

2. A SECOND CRITICAL PERIOD IS JUST AS THE PLANTS
ARE IN THE BOOT AND BEGINNING TO EMERGE FROM
THE BOOT. THE FLOWERING BEGINS. IF MOISTURE
IS SHORT AT THIS STAGE THE PLANT GREATLY
REDUCES THE NUMBER OF FLORETS POLLINATED, THUS
ADJUSTING PRODUCTION TO THE CURRENT OUTLOOK
FOR MOISTURE.

3. IF THE SOIL MOISTURE IS NEAR A CRITICAL LEVEL
AT BLOOMING AND IS NOT IMPROVED SHORTLY THERE-
AFTER, IT IS POSSIBLE THAT THERE WOULD NOT BE
ENOUGH MOISTURE TO FILL THE SEED. THIS COULD
RESULT IN REDUCTION IN QUALITY FROM SHRIVELED
SEED.

HARVESTING:

GRAIN CAN BE SAFELY STORED WHEN THE MOISTURE
CONTENT REACHES 15% OR UNDER.

YEILDS:

WITH PROPER CARE, A YIELD OF 4,000 LBS. PER
ACRE, OR BETTER, MAY BE OBTAINED.
