

ALMOND PRODUCTION COSTS

1986

Stanislaus and Merced Counties

INTRODUCTION

This cost study is designed to provide almond orchardists or prospective growers the estimated costs to establish a new orchard and costs to produce almonds in a mature orchard. This study is based on actual cash costs in better-than-average orchards with good management. The costs may be somewhat above average. The production estimates are definitely above average, but typical of very good orchards.

This study assumes that the operation has excellent soil, good water, very good equipment, and top management. Used equipment is often purchased for orchard use. This will reduce capital investment, depreciation and interest, but will likely increase repair costs, operating costs, and down time. This study uses costs based on 60% of new cost.

In this cost study, harvest costs are based on current custom harvest charges. Therefore, interest and depreciation charges for harvesting and hulling are not included in the production cost studies. A typical operation in this area will deliver nuts to cooperative or custom hullers for processing.

A major cost of farming is interest charges. This is especially true in establishing an orchard where there are interest charges on accumulated costs during the nonbearing years.

You, as a grower or prospective grower, should compare your actual cash costs, depreciation and interest costs to these projected costs.
